

# Rehabilitate with ProSix.

With ProSix, rehabilitation can start earlier, even immediately post-operatively in many cases. The horse receives the benefits of calming, strengthening, increased proprioceptive awareness, balanced weight bearing, and supportive deep touch pressure by simply wearing this comfortable, non-restrictive wrap. ProSix is ideal for the horse with activity restrictions, from stall rest to hand-walking, to supervised limited turnout.

## ProSix is a broad-spectrum rehabilitative tool for:

- Rehabilitation for neurological problems following veterinary diagnosis and treatment. (ex: parasites, illness or injury resulting in neurological deficits such as EPM, Wobblers, EHV-1, or West Nile Virus).
- Maintaining weight distribution among all four limbs, bilaterally and fore to hind, to prevent overload to non-injured limbs.
- Encouraging correct posture and balance. May also help to maintain chiropractic adjustments.
- Use following colic or other abdominal surgeries to provide support and strengthen abdominal muscles.
- Use with back pain and spinal issues to provide support with strengthening. Effective for treating impingement of dorsal spinous processes, muscle strain, other causes of back pain.
- Calming and reducing anxiety with deep touch pressure and gentle resistance band exercise. This makes handling during rehabilitation and treatment safer for any handler or equine professional.

## Rehabilitation made easy with ProSix.

**EASY** to observe improvement with lasting results.

**EASY** to put on and take off.

**EASY** for the horse to wear.

**EASY** to adjust.

**EASY** to clean. Hand wash, hang dry.

**ProSix is easy for clients to use.** It is comfortable, supportive, and non-restrictive for the horse allowing normal range of motion. It can be worn during hand-walking and stall rest when activity needs to be restricted. It is safe to be worn while lunging, in round pen work, on a walker, or at liberty in a small turnout.

ProSix can also be worn under or over any type of saddle, or with harness. There are no rigid treatment protocols; the horse should be observed for fatigue, exercise intolerance, or any increase in pain or discomfort. In a small, safe turnout, most horses will limit activity as needed.

Veterinarians working with owners create the optimum protocol with adjustments made as the horse progresses in its treatment. We are available for consult based on our experiences with other cases.

**ProSix is available in three sizes** (small, standard and large) **to fit a wide range of horses.** ProSix has five areas of adjustment for optimal fit.

A single ProSix may be used on multiple horses.
